WANTACE
SOLUTIONS SPRINT

Solutions Sprint Assignment — Draft for Final Review

PART A — REAL BUSINESS AUDIT (20%)

What you must do

Choose a business that makes, processes or repairs products (for example, a bakery, tailoring unit, printing press, furniture workshop or cloud kitchen). Speak to the owner/manager for at least 20 minutes. Follow one order from enquiry to delivery and payment. Ask permission before photos and before sharing the owner's contact details.

Business profile — complete with real information

Business name: Proshot Photography (confirm exact name)

Area: [Not provided — add the actual area after confirming]

Products/services: Design albums, frames and banners (confirm with the business)

Approximate order volume: 50 per day (user-provided; verify whether this means orders, customers, or products)

How orders arrive: [Not confirmed — ask the owner]

Current tracking tools: WhatsApp / phone calls (provided); notebook/register also mentioned in the problem and quotes — confirm whether both are used

Interview date and duration: [Not provided — add after completing the interview]

Person interviewed and role: [Not provided — complete after interview; get permission before sharing a name]

Interview questions — use these in the call/visit

1. What products do you make or process, and roughly how many orders do you handle daily or monthly?

2. How does a customer place an order?

3. Who records the order, and where is it recorded?

4. What happens from order confirmation through production, quality check, packing and delivery?

5. Who is responsible at each stage?

6. How do you know which orders are delayed?

7. What goes wrong most often? How often does it happen?

8. How much time or money does it cost, based on your estimate?

9. Can you show me an order slip, register, spreadsheet or other tracking method?

10. What is one change that would make the process easier?

Audit notes — fill after the interview

Current workflow (provisional, not yet observed): Customer enquiry → order recorded through the business's actual method [confirm] → work/production → customer update → delivery/payment [confirm every stage with the owner].

Reported problem (needs owner confirmation): Finding the current status of an order may take time when many orders are being handled.

Frequency: [Not provided — ask the owner; do not estimate]

Impact: [Not provided — ask the owner; do not guess]

Quote 1 (provided; verify it was said verbatim in the interview): “We write down customer orders in a notebook.”

Quote 2 (provided; verify it was said verbatim in the interview): “Sometimes, we need to check the register to know the order status.”

What I saw / was told / still needs checking: The supplied notes say orders are tracked using WhatsApp/phone calls and refer to a notebook/register. No direct observation has been documented yet. Confirm the actual tools and workflow with the owner.

Process-map photo and tracking evidence

Evidence status: NOT COLLECTED YET. Before submission, add a photo of your hand-drawn order-to-delivery process map and at least two photos of the business's current tracking method. Get permission first and blur phone numbers, personal details and sensitive amounts. Do not claim these photos exist until they are added.

One-page audit summary — provisional; finalise only after verification

Provisional summary — not a final audit finding: Proshot Photography is described as providing design albums, frames and banners. The reported volume is 50 per day, but the unit needs confirmation. WhatsApp/phone calls and a notebook/register are mentioned as tracking methods, but their actual use needs confirmation. The reported issue is that checking an order's current status may take time. No photos, process map, direct observation, quantified impact or owner permission have been provided yet. Complete these items before treating this as a finished audit.

PART B — REQUIREMENT DOCUMENT: VARDHAN STEELWARE (45%)

1. Problem statement

Suresh says the core issue is not a lack of orders but lack of visibility: “pata nahi chalta maal kahan atka hai.” When a customer asks for an update, he has to call Ramesh, whose status information is in a diary. Phase 1 should make order status, blockers and partial dispatches visible on Suresh’s phone without repeating the complexity of the ERP that staff abandoned in 2023.

2. Evidence and inconsistencies

Gupta Traders’ Kadai No.10 order appears twice on 1 Sep (200 pcs, ■185): one row says dispatched and another pending (“repeat msg?”). Treat this as a duplicate candidate, not a confirmed duplicate.

Jain Crockery’s Kadhai No.10 order appears on 2 Sep and 4 Sep (150 pcs, ■192); the second note says it was sent again on WhatsApp. Confirm whether it is a repeated record or a new order.

A 3 Sep dispatched row for 20 dozen Thali has no customer name.

Verma Utensils has 180 kg of Kadhai 10 pending with no rate; the note says “rate confirm karna hai.” Confirm the unit and rate before fulfilment/invoicing.

Sharma Bartan’s 30-dozen glass order is on payment hold with ■1.8 lakh old dues. A separate row records a -6 dozen return for dents. Track returns separately from the original order quantity.

Mehra Kitchenware’s 300-piece order is split: 180 dispatched and 120 later dispatched. Support partial dispatches and remaining quantity.

For outsourced polishing, 420 kg was sent to Pappu, 1,180 pieces came back and a 6 kg shortage was reported. Kilograms and pieces are different units; do not calculate yield/shortage without an agreed conversion or reconciliation method.

Bansal’s Tope order remains pending because polishing has not returned; a later 60-piece row may be a new order or remaining quantity. Confirm before merging.

Client statements vs evidence

Suresh estimates 60–70 orders per month, while Kunal says there are more; the supplied one-week extract does not verify either figure. Kunal says online sales grow 30% monthly, while Suresh says online is under 5% of business; clarify the metric, period and share. Suresh says payments are not a problem, but the records show payment holds and old dues. The client describes a 3–4% steel difference as wastage; the supplied evidence does not establish its cause. The prior ERP cost ■1.2 lakh and ran for three months because staff did not use it.

3. Current process (to validate)

1) Distributor contacts the business by phone/WhatsApp; online orders also arrive through marketplaces.

2) Kunal records orders in a Google Sheet; repeated messages may create repeated rows.

3) Production prepares goods; status ownership and timestamps are unclear.

4) Goods go to 4–5 external polishing contractors; input is weighed and returned output is counted.

5) Munshi ji reconciles quantities/accounts using Tally and manual records.

6) Ramesh tracks floor/dispatch status in a diary and WhatsApp; partial quantities may be dispatched.

7) Payment holds are communicated by phone/WhatsApp and may require Suresh's confirmation.

8) Status, dispatch and payment blockers are not visible in one reliable live view. Validate handoffs with Ramesh and Munshi ji.

4. Phase 1 scope

IN SCOPE

- Central order register with unique Order ID and line-item IDs; record channel and original reference.
- Status per order line: New → Confirmed → In production → Sent for polishing → Returned/reconciliation pending → Ready to pack → Partially dispatched → Dispatched; also On hold / Cancelled / Returned.
- Data-quality flags for missing customer, rate, ambiguous unit, invalid quantity and duplicate-like rows for human review.
- Partial dispatch and returns as separate linked records.
- Polishing batch log: contractor, quantity sent/unit, quantity received/unit, dates, reconciliation status, variance note and reviewer.
- Payment-hold flag with reason, approver and release status; do not replace Tally.
- Mobile-friendly view for Suresh; low-friction updates for staff; audit trail of who changed what and when.
- Three morning exception reports.

OUT OF SCOPE

- AI sales forecasting until reliable baseline data and metrics exist.
- Full ERP replacement/accounting ledger; Tally remains the accounting source initially.
- Complex marketplace integrations; start with channel tagging/manual import until needs and volumes are verified.
- Automated yield calculations across kg-to-piece units and contractor logins until rules and operational need are confirmed.

Rationale: solve the verified pain—knowing where an order is stuck—with a workflow staff can adopt. Confirm scope with the client before build.

5. Data model

Customer(CustomerID, name, contact, channel, payment-hold status)

Order(OrderID, CustomerID nullable until resolved, order date, source/channel, entered by, overall status, original reference)

OrderLine(OrderLineID, OrderID, product/SKU, quantity, unit, rate, line status, required date)

StatusEvent(EventID, OrderLineID, status, timestamp, updated by, note/blocker)

PolishingBatch(BatchID, contractor, sent date, sent quantity/unit, received date, received quantity/unit, reconciliation status, variance note, reviewed by)

Dispatch(DispatchID, OrderLineID, quantity, unit, dispatch date, delivery reference)

Return(ReturnID, OrderLineID, quantity, unit, reason, date, disposition)

PaymentHold(HoldID, CustomerID, optional OrderID, reason, authorised amount/reference if needed, raised by, approved/released by, status)

Relationships: one Customer has many Orders; one Order has many OrderLines; one OrderLine has many StatusEvents, Dispatches and Returns; a line can link to polishing batches when traceability is needed. Keep payment accounting in Tally for Phase 1; store a reference/status only if required. Append dispatch/return transactions instead of overwriting history.

6. Users and mobile permissions

Suresh — Owner: view order status, delays, holds and exceptions; approve/reject hold release if confirmed as his responsibility.

Kunal — Order coordinator: create/edit orders, resolve duplicate candidates, correct customer/unit/rate data and monitor progress.

Ramesh — Operations/dispatch: update production/ready/dispatch stages and partial quantities; see relevant work.

Munshi ji — Accounts: flag payment holds, review returns and reconcile polishing records; Tally remains the accounting source.

Contractors — no login in Phase 1; internal staff record handoffs and returns. Revisit only if needed.

All changes should capture user and timestamp; restrict sensitive payment details by role.

7. Three morning reports

1) Pending orders by stage and age: order/customer, item, remaining quantity, stage, days in stage, expected date and owner.

2) Blocked orders: payment hold, missing customer/rate/unit, unresolved duplicate, polishing not returned or other blocker; include next action owner and age.

3) Polishing reconciliation: contractor/batch, sent quantity/unit, received quantity/unit, variance/reconciliation status, outstanding batches and reviewer. Never compare kg and pieces as equivalent units.

8. Questions for the next call

Ask Suresh: (1) What minimum status information must appear on his phone each morning? (2) Who can place/release payment holds and what counts as payment cleared? (3) What is the exact pre-Diwali pilot deadline and which workflows can be excluded?

Ask Kunal: (4) What is the authoritative order ID and how are repeated messages distinguished from new orders? (5) What does “online grows 30% monthly” measure, over what period, and what is online’s current share? (6) What units/rate rules are valid and how are missing fields resolved?

Ask Ramesh: (7) What are the actual stages and what event completes each stage? (8) How are partial dispatches, balances and delivery confirmation recorded?

Ask Munshi ji: (9) How are returns, dues and holds reflected between Tally and the order sheet? (10) How should kg-in/pieces-out polishing be reconciled, and who signs off variance?

9. Biggest risk and mitigation

Biggest risk: low adoption by shop-floor/dispatch users, demonstrated by the previous ERP being abandoned after three months. Co-design statuses with Ramesh and staff; minimise typing; pilot with a small number of live orders and one polishing contractor; assign an owner to every status; review exceptions daily; measure whether updates happen without repeated chasing. Expand only after reliable pilot usage.

PART C — ACCOUNT EXECUTIVE HANDOFF (8%)

Deal snapshot

Decision-maker: Suresh Vardhan signs cheques; confirm final purchasing authority. Influencer/order-sheet owner: Kunal Vardhan. Likely daily users: Ramesh (operations/dispatch), Kunal (orders), Munshi ji (accounts). Validate with the team.

Core pain and evidence

Suresh cannot quickly see where orders are stuck and calls Ramesh for updates. Evidence includes repeated-looking order rows, a missing customer, a missing rate/unit issue, partial dispatches, payment holds and outsourced polishing reconciliation across a sheet, diary, WhatsApp and Tally.

Request vs need

Kunal asks for marketplace integrations and AI forecasting; Suresh mainly wants order status on his phone. Demonstrate order traceability, blockers, partial dispatch and polishing reconciliation first. Defer forecasting and complex integrations until data quality, online share and business value are verified.

Likely objections and response

“We paid ■1.2 lakh for an ERP and staff didn’t use it.” Show a tiny mobile-first workflow with actual users and a limited pilot.

“Need it before Diwali.” Agree a smallest usable pilot and confirm the date/must-have stages; do not promise a timeline before technical validation.

“We need AI/integrations.” Explain that reliable order data and adoption are prerequisites; discuss a phased roadmap after Phase 1.

“Differences are just wastage.” Validate how kg sent and pieces received are reconciled; do not assign blame or calculate a percentage without agreed units.

Recommended next step

Schedule a workflow walkthrough with Suresh, Kunal, Ramesh and Munshi ji. Use one real order, one payment hold and one polishing batch to validate stages, permissions and exception handling. AE owns pricing and negotiation; this handoff does not propose a price.

PART D — LINKEDIN POST + META AD (12%)

LinkedIn post — revise to match the real audit

A delayed order is not always a production problem.

In small manufacturing businesses, a harder problem can be knowing where an order is right now—and who has the latest update.

When order details live in a register, status updates sit in WhatsApp, and dispatch information stays with one person, even a simple customer question can trigger several calls.

A practical first step is not necessarily a large ERP or an AI dashboard. It is one shared order record, a small set of clear statuses, and a visible owner for every blocker.

In a business workflow review, the useful improvement is the one people can actually update during a busy day. Use this post only after the final audit supports the insight; do not imply an audit was completed before it happens.

Factory owners: where does an order most often get stuck in your workflow?

Before using this post, make sure the insight matches what you actually saw or heard. Do not name the business.

Meta ad

Language: English draft. Use the language your actual audience is comfortable with.

Primary text: “Still calling around to find out where an order is stuck? Bring order status, pending work and dispatch updates into one simple view. Start with the workflow your team already follows—without forcing everyone into a complicated system.”

Headline: “Know Where Every Order Stands”

Creative concept: split-screen—paper register, scattered WhatsApp messages and missed-call icons on one side; a simple phone view showing order stage, blocker and next owner on the other. Avoid promises such as guaranteed zero delays or specific revenue growth.

PART A — COMPLETION KIT (USE DURING THE REAL VISIT)

This section helps you collect the missing evidence. Fill it only after speaking with the owner/manager and observing the real workflow. Do not submit sample text as if it were observed fact.

1. Short interview opening

“Hello, I’m completing a student assignment about how a local business manages orders. Could I ask you a few questions about your current process? I may take photos of the order-tracking tools for the assignment, but only if you give permission. I will not share private customer information.”

2. Questions to ask the owner or manager

- What products or services do you provide?
- About how many orders do you receive in a normal day or week? What exactly does that number count?
- How does a new order arrive (in person, phone, WhatsApp, or another way)?
- Where do you record the order details?
- Who updates the order when work starts, is delayed, or is completed?
- How do you check the current status of an order?
- What is the most common problem with tracking orders?
- Can you give a recent example of an order that was delayed or difficult to track?

How often does this happen, and what effect does it have? Please estimate only if you know.

What information would you want to see in one simple order-status view?

3. Record the actual workflow

After observing, write the real steps in order. Use the boxes below as a template; replace each bracket with what actually happens.

Customer enquiry [actual channel]	Order recorded [where/by whom]	Work in progress [who handles it]	Status update [how/customer told]	Completed / delivered [how confirmed]

Important: This is a blank workflow template, not evidence of the business's actual process. Confirm each step and who is responsible.

4. Photos and evidence checklist

Photo 1: Current order-tracking tool (notebook/register, WhatsApp screen, spreadsheet, or other real tool).

Photo 2: A second view showing how order status or pending work is tracked.

Process map: A photo of your hand-drawn map after validating the workflow.

Before taking photos, ask permission. Avoid showing customer names, phone numbers, addresses, payment details, or other private information.

Insert the actual photos in the final document. Do not leave these checklist lines as a substitute for evidence.

5. Verify the two owner quotes

Only use quotation marks if you wrote down the owner's exact words during the real conversation. If the sentences were paraphrased, remove quotation marks and label them as a summary instead.

Quote 1 — exact words heard: [Write after interview]

Quote 2 — exact words heard: [Write after interview]

If the previously drafted quotes were not spoken exactly, do not use them as direct quotes.

6. Permission to share business details

Ask: “May I include your business name and area in my student assignment? The assignment also asks for a contact phone number. Are you comfortable with me sharing that number with the assignment reviewer? May I include photos of the tracking tools if private details are hidden?”

Permission status: [Yes / No / Not asked yet]. Record only what the owner actually agrees to. If permission is not granted, do not share the phone number or identifiable information; contact the assignment organiser to ask about an alternative.

7. Check whether the business qualifies

The brief asks for a real manufacturing, processing, or repair business. Proshot Photography appears to be a photography/album design shop based on the current information. It may not meet that requirement. Confirm the exact wording with the assignment brief or organiser before relying on it for Part A.

If it does not qualify, choose a real local manufacturer, processor, or repair business, and repeat the interview and evidence collection there. Do not relabel the photography shop as manufacturing.

8. Final Part A submission gate

- ■ I personally interviewed the owner/manager and recorded the date and duration.
- ■ I confirmed the business type and that it meets the assignment requirement.
- ■ I confirmed what the reported daily/weekly order volume counts.
- ■ I observed and mapped the actual workflow.
- ■ I have at least two real tracking-tool photos and a photo of the process map.
- ■ The two quotes are verbatim or clearly labelled as paraphrases.

- ■ I obtained permission for any business name, phone number, and photos shared.
- ■ I removed private customer information from the evidence.
- ■ I replaced all placeholders and deleted this checklist from the final copy if not requested.

What is still missing right now

The current information does not establish that the owner interview was completed, that the quotes are verbatim, that the process map or photos exist, that permission was obtained, or that this business qualifies under the brief. Those items cannot be truthfully completed by writing alone.

PART A — FILLED WORKING DRAFT FROM DETAILS PROVIDED

Status: This section uses the details supplied in the chat. The interview, exact quotes, workflow, photos, permission, and business eligibility have not been independently verified. Do not describe the process map below as an observed workflow until the owner confirms it.

Business profile

Business name: Proshot Photography (confirm spelling/name)

Business type: Photography / album design shop

Products/services: Design albums, frames, banners

Reported order volume: 50 per day (confirm whether this counts orders, customers, or products)

Tracking methods reported in the supplied details: WhatsApp / phone calls; notebook/register is also mentioned and needs confirmation

Problem statement

The information provided suggests that checking the current status of an order may take time when many orders are being handled. A simple shared order-status record could help staff find order details, see what is still pending, and communicate updates more consistently. This is a preliminary interpretation and should be confirmed with the owner.

Owner quotes supplied for the draft

Quote 1: “We write down customer orders in a notebook.”

Quote 2: “Sometimes, we need to check the register to know the order status.”

Verification note: These are included because they were supplied in the conversation as exact quotes. Confirm they were spoken verbatim by the owner before presenting them as interview evidence. If not, replace them with the exact words or label them as paraphrases.

Provisional process map — confirm each step with the business

Customer enquiry → order details received → details recorded in the actual tool → album/frame/banner work arranged → progress checked through the actual tracking method → customer updated → completed order handed over.

This is an inferred draft flow based on the type of service and supplied tracking details, not a confirmed observation. Ask the owner who performs each step, what tools they use, and what happens when an order is delayed. Replace this flow with the actual process before submission.

Initial recommendation

If the owner confirms that status checks are a recurring problem, start with a simple order register containing an order ID, customer reference, product/service, order date, promised date, current status, next action, and person responsible. A mobile-friendly Google Sheet or similarly simple tool may be a low-cost pilot. Do not recommend a complex system until the daily workflow and staff needs are understood.

Evidence and permission status

Interview: not confirmed as completed in the information provided.

Process-map photo: not collected yet.

Tracking-tool photos: not collected yet.

Owner permission to share the business name/contact details/photos: not yet obtained.

Owner phone number and business area: not provided.

Business eligibility: uncertain because the assignment asks for a manufacturing, processing, or repair business; a photography/album design shop may not qualify.

Part A finalisation decision

This is the most complete honest draft possible from the information currently available. The missing real-world evidence cannot be filled in accurately by an AI-generated sentence or diagram. If the business does not meet the required category, use a qualifying local manufacturing, processing, or repair business for Part A.
